LISTING OF CURRENT CLAIMS

Claims 1-12. (Canceled)

13. (New) An easily controlled exhaust tube having:

a manifold; one end of the manifold being connected to a distal end of a connecting tube,

the manifold being extended with a first branch tube and a second branch tube,

the second branch tube has a controllable valve having a valve seat and washers,

the first branch tube is segmented into a first and second section within a first outer tube, wherein the first and second sections have holes surrounded by a layer of stainless steel and cotton, a first isolating plate perpendicular to the first section within the first outer tube, a second isolating plate perpendicular to the second section within the first outer tube, wherein the first and second isolating plates define three volumes within the first outer tube, holes from the first section communicate with a first and second volume, holes from the second section communicate with a second and third

volume.

the second branch tube passes continuously through a second outer tube, wherein the portion of the second branch tube within the second outer tube has holes, a layer of stainless steel and cotton covering the holes, glass fibers fill the volume between the second outer tube and the layers of stainless steel and cotton,

a connecting piece welded between the first outer tube and the second outer tube.
